Madam, in these challenging times stress, has affected every age group. Around 50% of all males and females’ experience post-traumatic stress disorder (PTSD) in their lives(1). Music has proved to be effective to deal with PTSD after an evaluation done by a study showed that patients undergoing music therapy had a significant decrease in PTSD when compared to those patients who did not take any therapy(2). Even though all these measures cross-nationally lifetime prevalence of PTSD was 3.9% cross-nationally, half of all global cases were persistent(3). Despite of these deteriorating effects, no preventive and rehabilitative measures can be seen in Pakistan.

A study in 2019 concluded that active music-instruction programmes hold promise to alleviate PTSD and depressive symptoms among the population globally(4). Further, people treated with music therapy had a significant mean difference [p = 0.0035] when contrasted with those who did not undergo treatment.(2).

A study in 2016 concluded that the prevalence of PTSD in Pakistan was 26% (78 out of 299 individuals)(5). During the covid-19 pandemic, another study records this percentage to have risen up to 40.2% by June 2020(1). It is evident that PTSD had harmed the population with its radical escalation in pre and post covid-19 pandemic., Therefore it is, crucial to take steps in the right direction by increasing awareness in public and introducing viable and cost-effective methods that are easily accessible to people and aid in resolving this dilemma in its early stages during these challenging times.
times. Implementation of various methods is crucial to reduce the prevalence of PTSD during Covid-19 in Pakistan. Music therapy can serve as one of the interventions to reduce the bars of PTSD in Pakistan significantly.
